

ABSTRACT

5 A pig for installing a cable in a conduit,
characterised in that it comprises a body (2, 2', 2'')
and a seal (3, 3', 3'') intended to follow the internal
surface of the conduit (8), the body comprising a
radially elastic tubular part (9) on which the seal is
10 mounted, and a support part (13, 13', 13'') fixed to or
integral with the tubular part, the support part having
a guide surface (14) intended to guide the pig in the
conduit, the diameter of the guide surface being
slightly less than the maximum diameter of the seal, so
15 that the support part radially deforms the tubular part
when the pig passes through deformed parts of the
conduit.
